

What happens at each numbered point on the voyage

(every crossing is a state transition where the speed may change)

- 1 crosses d_1 — weather cell (space, 0.5°)
- 2 crosses $t = 6$ — 6 h block (time)
- 3 crosses d_2 — weather cell (space, 0.5°)
- 4 crosses $t = 12$ — 6 h block (time)
- 5 crosses d_3 — heading change (course ψ)
- 6 crosses $t = 18$ — 6 h block (time)
- 7 crosses d_4 — weather cell (space, 0.5°)
- 8 crosses $t = 24$ — 6 h block (time)
- 9 crosses d_5 — weather cell (space, 0.5°)
- 10 reaches (L, T) — arrival at the ETA
